ö This sequence is encoded by a cDNA of the invention, designated Gene No. 13. This sequence represents a human secreted protein, and is expressed protein, and is expressed in keratinocytes and to a lesser extent in endothelial cells and placenta. The DNA sequences of the invention and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the DNA sequences. Specific uses are described for each of the DNA sequences and the encoded proteins, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurological disorders, developmental diseases of the immune system (including allergies or asthma), hepatic disease, Alzheimer's and cognitive disorders, schizophrenia, prostate diseases, autoimmune disorders and AIDS. The polypeptides are also useful 9 9 designated Gene No 1 MARGSLRRILIRLIVLGLWLALLRSVAGEQAPGTAPCSRGSSWSADLDKCMDCASCRARPH 1 MARGSLRRLLRLLVLGLWLALLRSVAGEQAPGTAPCSRGSSWSADLDKCWDCASCRARPH Gaps tratement of cancer, tumours, neurological disorders, developmental abnormalities and foetal deficiencies, blood disorders, leukaemias, 61 SDFCLGCAAAPPAPFRLLWPILGGALSLTFVLGLLSGFLVWRRCRRERSSPPP . 0 Length 114; 0; Indels 99.8%; Score 607; DB 2; I 100.0%; Pred. This is the amino acid sequence of a transmembrane protein encoded by human liver CDNA clone HP10432 (see AAV84374). The encoded protein has a signal-like N-terminal region and one internal transmembrane domain. The invention provides nucleotide sequences (see AAV84359-76) coding for 18 transmembrane proteins (see AAW8491-508), vectors containing such polymucleotides, and eukaryotic cells containing the vectors. The proteins can be used as antigens or as compositions in the preparation of antibodies against the proteins. The polymucleotides can be used as probes for gene diagnosis, and as gene sources for gene therapy and large-scale production of proteins encoded by the cDNA. The host cells are used for the detection of ligands corresponding to the expressed proteins, and the screening of low mol.wt. medicines

              transmembrane protein have immunospecific, antiproliferative and neuroprotective activities. The human transmembrane proteins, polynucleorides encoding them and other compositions and methods from the present invention, can be used for the diagnosis, treatment or prevention of immune, reproductive, smooth muscle, neurological, gastrointestinal, to treat or prevent disorders associated with a decreased expression or activity of HTMPN

TWEAK protein is a member of the tumour necrosis factor (TNF) family and induces angiogenesis. TWEAKR may therefore be used to screen for and develop TWEAKR agonists and antagonists for the modulation of angiogenesis. TWEAKR may therefore be used to screen for and develop TWEAKR agonists and antagonists for the modulation of angiogenesis, to be used in the treatment and diagnosis of human disease. The disorders mediated by angiogenesis include ocular disorders characterised by ocular neovascularisation such as diabetic retinopathy, neovascular glaucoma, retinopathy of prematurity, cretrolental fibroplasia, rubeosis, uveitis, macular degeneration and correlation and profit and provascularisation, and inflammatory diseases such as arthritis, rheumatism and psoriasis. Other treatable diseases include anthorizing and metastatic conditions such as sarcomas and carcinomas, malignant and metastatic conditions, myocardial angiogenesis, chaemophilic joints, scleroderma, vascular adhesions, atherosclerotic plaque neovascularisation, telangiectasia, wound granulation, coronary contary atherosclerosis, peripheral atherosclerosis and ischaemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0

The invention describes methods of modulating angiogenesis and inhibiting tumour progression using TWEAK (a novel member of the tumour necrosis factor or TWF family) receptor agonists. Conditions which can be treated using the agonists include myocardial ischaemic conditions (e.g. myocardial infarction), wound healing (e.g. burn healing and healing of gastric ulcers), and tissue and organ transplanteations to promote neovascularisation, particularly in subjects suffering from vascular insufficiency (e.g. diabetic patients). Inhibition of angiogenesis and subsequently neovascularisation is useful in treatment of cancer, inflammatory macular degeneration and diabetic retinopathy. This sequence represents the human type I transmembrane protein Fn14, a TWEAK receptor described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cytostatic; cerebroprotective; neuroprotective; nootropic; cardiovascular; antiarteriosclerotic; gene therapy; cardiovascular; antiarteriosclerotic; gene therapy; neuroprotective; noterapy; neuroprotective; noterapy; new secreted protein; immune disorder; inflammation; respiratory disorder; cancer; CNS disorder; neurodegenerative disorders; inflammatory bowel disease; nephritis; Crohn's disease; asthma; allergy; multiple solerosis; achteroslerosis; myocarditis; chromosome mapping; triple helix formation; antisense gene therapy; forensic biology.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0
                                                                                                                                                                                                                                                       The invention relates to a purified protein (I), comprising one of 90 fully defined sequences (ABP61424-ABP61513) or a protein based on any of the sequences but with some amino acids deleted, substituted or added and with a NF-kB (nuclear factor kappa B) activating effect. The protein and encoding gene (ABC91912-ABC92001) are useful in diagnosis and screening inhibitors or prometers to control excessive activation or inhibition and for treating e.g. inflammations, autolimmume diseases, cancers, inflammations, autolimmume diseases, cancers, inflammations, hone diseases, AIDS, neurodegenerative diseases or ischaemic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            tumour progression;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9

The invention relates to 592 new human secreted polypeptides useful for Claim 13; SEQ ID NO 1079; 1754pp; English

the invention teletes to 59% new numan secreted polypeptides useful for diagnosing, treating or preventing e.g. immune disorders, inflammatory conditions, respiratory disorders, cancers, CNS disorders, or neurodegenerative disorders, or polypeptides comprising an amino acid sequence at least 95% identical to the new sequences. The polypeptides, catids encoding the polypeptides, agonists or antagonists that binds to the polypeptides are useful in preparing diagnostic or pharmaceutical compositions for diagnosing, treating diagnostic or pharmaceutical compositions for diagnosing, treating of preventing an e.g. immune disorders (e.g. gastric, ovarian or lung cancer), CNS disorders (e.g. multiple sclerosis or ischaemic brain injury), neurodegenerative cardiovascular disorders (e.g. atherosclerosis or myocarditis). The collymolectides are useful for chromosome identification, chromosome or antisense DNA or RNA, in gene therapy, for identifying individuals from minute biological samples, in forensic biology, and as hybridization probes. The polypeptides are useful for as molecular weight markers on sodium dodecyl sulface-polyacrylamide gel electrophoresis (SDS-PAGE) gels, to raise antibodies, for testing biological activities, and for treating or preventing neural disorders, immune system disorders, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, proliferative and/or cancerous diseases. This sequence corresponds to one of the polypeptide of the invention. Note: The sequence data for this patent did form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polymucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits concerned or decreased expression in lung cancer samples. Lung cancer samples compound that modulates a lung cancer-associated polypeptide, for compound that modulates a lung cancer-associated polypeptide, for cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful for treating lung cancer, such as small cell lung cancer, non-small cell for treating lung cancer or precancerous leasions, e.g. attenderasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, chypersensitivity pneumonitis, interstitial pulmonary disease, is asthma and bronchiectasis. The genes, polymucleotides and polypeptides are useful for diagnostic purposes and as targets for screening for therapeutic compounds that modulate lung cancer, such as antibodies. Sequences Detecting a lung cancer-associated transcript in a cell from a patient for treating lung cancer, by contacting a biological sample from the patient with a polynucleotide that exhibits increased or decreased expression in lung cancer. The present invention relates to an isolated polypeptide or human secreted protein. The polypeptides, nucleic acid molecules, antibodies or their fragmentes, and agonists or antigonists that bind are useful for preparing a diagnostic or pharmaceutical composition for diagnosting or treating allergic or asthmatic disorders. The polypeptide is also useful cor their fighting partner by contexting the polypeptide with a binding partner, and determining whether the binding partner increases to binding partner are also useful for detecting, preventing, diagnosing, prognosticating, treating or ameliocrating inflammatory disorders compastic diseases, wound healing and disorders of epithelial cell composition immune disorders, cardiovascular disorders blood-related disorders. The nucleic acids are also useful for chromosome context infectious diseases, endocrine disorders, or gastrointestinal disorders. The nucleic acids are also useful for chromosome contential and markers, or as hybridization or diagnostic probes. The polypeptides and antibodies are useful for providing immunological probes for differential identification of the tissues immunological probes for differential identification of the tissues immunological probes for differential identification a human contents a human contents and antibodies are useful.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0

```
The present invention relates to antibodies against tumour-associated antigenic target polypeptide. The antibody is useful for treating or diagnosing tumours or cancers in mammals, e.g. prostate cancer, lung cancer, breast caner, colon cancer, ovarian cancer, prostate adenocarcinomas, renal cell carcinomas, or pleural mesothelioma. The present sequence represents a TAT polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 MARGSLRRLLRLLVLGLWLALLRSVAGEQAPGTAPCSRGSSWSADLDKCMDCASCRARPH

tumour progression using TWEAK (a novel member of the tumour necrosis factor or TNF family) receptor agonists. Conditions which can be treated using the agonists include myocardial ischaemic conditions (e.g. myocardial infarction), wound healing (e.g. burn healing and healing of gastric ulcers), and tissue and organ transplantations to promote neovascularisation, particularly in subjects suffering from vascular insufficiency (e.g. diabetic patients). Inhibition of angiogenesis and subsequently neovascularisation is useful in treatment of cancer, inflammatory macular degeneration and diabetic retinopathy. This sequence represents the mouse type I transmembrane protein Ful4, a TWEAK receptor
                                                                                                                                                                                                                                                                                                                                                                                                                The invention describes methods of modulating angiogenesis and inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ocular neovascularisation, diabetic retinopathy, neovascular glaucoma, retinoblastoma, retinopathy of prematurity, retrolental fibroplasia, rubeosis, uveitis, macular degeneration, arthritis, rheumatism, corneal graft neovascularisation, psoriasis, metastatic condition, malignant tumour, sarcoma, carcinoma, benign tumour, haemophilic joint, preneoplastic condition, myocardial angiogenesis, wound granulation, scleroderma, vascular adhesion, telangiectasia, ischemia, human, atherosclerotic plaque neovascularisation; coronary atherosclerosis;

```
The sequence represents a fusion protein consisting of the human TWEAK receptor (TWEAKR) protein extracellular domain fused to an Fc portion from human 1961. This fusion protein, TWEAKR-Fc, is used in the preparation of TWEAKR agonists and antagonists. The TWEAK protein is a majogenesis. TWEAKR may therefore be used to screen for and develop TWEAKR agonists and antagonists for the modulation of angiogenesis, to be used in the treatment and diagnosis of human disease. The disorders canding angiogenesis include ocular disorders characterised by onclar neovascularisation such as diabetic retinopathy, neovascular glaucoma, retinopathy of prematurity, retrolental fibroplasia, retinopathy of prematurity, retrolental fibroplasia, cubeosis, uveitis, macular degeneration and corneal graft neovascularisation, and inflammatory diseases such as arthritis, cheumatism and psoriasis. Other treatable diseases include malignant and metastatic conditions such as sarcomas and carcinomas, benign tumours and prematurine and prematicular allegal angiogenesis, haemophilic joints, conditions autheriosclerotic plaque.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Modulating angiogenesis in a mammal for treating diseases mediated by angiogenesis, e.g. solid tumors and vascular deficiencies of cardiac or peripheral tissue, by administering antagonist or agonist of TWEAK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    neovascularisation, telangiectasia, wound granulation, coronary atherosclerosis, peripheral atherosclerosis and ischaemia

The polynucleotide sequences given in AAA26346 to AAA26458 encode the human secreted proteins given in AAY91451 to AAY91691. The human secreted proteins given in AAY91451 to AAY91691. The human secreted proteins can have activities based on the tissues and cells they are expressed in. Examples of the activities are: cytostatic; they are influenced in munosuppressive; antifary antiantlammatory; nootropic; neuroprotective; antialergic; osteopathic; antiarthritic; antibacterial; antidiabetic; antiathma; antipsoriatic; and cardiant. The polynucleotides and their corresponding secreted proteins are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the polynucleotides. Specific uses are described for each of the colynucleotides, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, diseases of the immune system, autoimmune diseases, hepatic and renal diseases of the immune system, autoimmune diseases, hepatic and renal disease, inflammation, allergies, arthritis, infections, AlbS, spinal cord injuries, insection, allergies, arthritis, infections, AlbS, spinal cord injuries, insection,
                                                                                                                                   Human; secreted protein; diagnosis; cytostatic; immunosuppressive; antiHIV; antiinflammatory; nootropic; neuroprotective; antiallergic; osteopathic; antiarthritic; antibacterial; antidiabetic; antiasthma; antipsoriatic; cardiant; gene therapy; cancer; neurological disorder; immune disease; inflammation; blood disorder; tumour; chromosome 16.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated human genes and the secreted polypeptides they encode, useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders.
                                                                                           Human secreted protein sequence encoded by gene 13 SEQ ID NO:136.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Komatsoulis GA, Rosen CA, Ruben SM, Duan R, Moore PA,

New human secreted polypeptides and polymucleotides, useful for diagnosing, treating or preventing e.g. immune disorders, inflammatory conditions, respiratory disorders, cancers, CNS disorders, or neurodegenerative disorders N-PSDB; ADA56496.

2003-167512/16.

Claim 13; SEQ ID NO 1582; 1754pp; English.

neurodegenerative disorders, or polypeptides comprising an amino acid sequence at least 95% identical to the new sequences. The polypeptides, antibodies or antibody fragments that bind to the polypeptides, uncleic acids encoding the polypeptides, agoniers or antagonists that binds to the polypeptide, are useful in preparing diagnostic or pharmaceutical compositions for diagnoshing, treating or preventing an e.g. immune disorders, inflammatory conditions (e.g. inflammatory bowel disease, nephritis or Crohn's disease), respiratory disorders (e.g. asthma and allergy), cancers (e.g. gastric, ovarian or lung cancer), CNS disorders (e.g. multiple sclerosis or ischaemic brain injury), neurodegenerative disorders (e.g. parkinson's disease or Alzheimer's disease), and cardiovascular disorders (e.g. atherosclerosis or myocarditis). The polynucleotides are useful for chromosome identification, chromosome mapping, for controlling gene expression through triple helix formation or antisense DNA or RNA, in gene therapy, for identifying individuals The invention relates to 592 new human secreted polypeptides useful for diagnosing, treating or preventing e.g. immune disorders, inflammatory conditions, respiratory disorders, cancers, CNS disorders, or

```
۲;
from minute biological samples, in forensic biology, and as hybridization probes. The polypeptides are useful for as molecular weight markers on sodium dedecyl sulfate-polyacrylamide gel electrophoresis (SDS-PAGE) gels, to raise antibodies, for testing biological activities, and for treating or preventing neural disorders, immune system disorders, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, proliferative and/or cancerous diseases. This sequence corresponds the polypeptide of the invention. Note: The sequence data for this patent did form part of the printed specification, but was obtained ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Sequence 29850, Application US/09252991A

Patent No. 6551795
GRNERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
CURRENT APPLICATION NUMBER: US 60/074,788
PRIOR FILING DATE: 1999-02-18
PRIOR FILING DATE: 1999-02-18
PRIOR FILING DATE: 1999-07-17
NUMBER: US 60/094,190
PRIOR FILING DATE: 1998-07-27
NUMBER: PRIOR PRIOR DATE: 1998-07-27
NUMBER: PRIOR PRIOR DATE: 1998-07-27
                                                                                                                                                                                                                                                                          APPLICANT: MARCA J. Rubenfield et al.
APPLICANT: MARCA J. Rubenfield et al.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 18755, Application US/09252991A
Patent No. 6551795
GENERAL INFORMATION:
PAPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERGIGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REPERENCE: 107136-136
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/074,190
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-02-18
RIOR APPLICATION NUMBER: US 60/094,190
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 18795
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Rubenfield et al. ```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

               of apoptosis in some cell types. Promotes angiogenesis and the proliferation of endothelial cells. May modulate cellular adhesion to matrix proteins.
Receptor for INFSF12/TWBAK (By similarity). Weak inducer
                                                                  -!- SUBUNIT: Associates with TRAF1 and TRAF2, and probably also with TRAF3 (By similarity)
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- TISSUE SPECIFICITY: Highly expressed in fetal heart, intestine, kidney, liver, lung and skin, and in adult heart and ovary. Intermediate expression in adult kidney, lung and skin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TUMOR NECROSIS FACTOR RECEPTOR SUPERFAMILY MEMBER FN14.

Note=No experimental confirmation available; TISSUE SPECIFICITY: Highly expressed in spleen and lymph node, and in resting B-cells. Detected at lower levels in activated B-cells, resting CD4+ T-cells, in thymus and peripheral blood leukocytes. SIMILARITY: Contains 1 TNFR-Cys repeat.

MEDLINE=21475520; PubMed=11591325; Yan M., Brady J.R., Chan B., Lee W.P., Hsu B., Harless S.M., Yan M., Brady J.R., Chan B., Lee W.P., Hsu B., Harless S.M., Lentron M.P., Grewal I.S., Dixit V.M.;
"Identification of a novel receptor for B lymphocyte stimulator that is mutated in a mouse strain with severe B cell deficiency.";
-1. FUNCTION: B-cell receptor specific for TNFSF13B/TALLI/BAFF/BLyS. Promoces the survival of mature B-cells and the B-cell response.
-1. SUBCELDULAR LOCATION: Type III membrane protein (Probable).

Event=Alternative splicing; Named isoforms=2;

lsoId=Q96RJ3-2; Sequence=VSP_006505; IsoId=Q96RJ3-1; Sequence=Displayed;
